Problem 1

Examples of blackboard and calligraphic letters: $\mathbb{R}^d \supset \mathbb{S}^{d-1}$, $\mathcal{C} \subset \mathcal{B}$. Examples of bold-faced letters (perhaps suitable for matrix and vectors):

$$\text{Assignment Project Exam Help} \quad (1)$$

Example of a custom-defined math operator:

$$\text{https://powcoder.com}$$

Example of references: the Lagrangian is given in Eq. (1), and Theorem 1 is interesting.

Example of adaptively-sized parentheses:

$$\text{Add WeChat powcoder}$$
$$\left(\prod_{i=1}^n x_i\right) + \left(\prod_{i=1}^n y_i\right) \leq \left(\prod_{i=1}^n (x_i + y_i)\right).$$

Example of aligned equations:

$$\begin{aligned} \Pr(X = 1 \mid Y = 1) &= \frac{\Pr(X = 1 \wedge Y = 1)}{\Pr(Y = 1)} \\ &= \underbrace{\frac{\Pr(Y = 1 \mid X = 1) \cdot \Pr(X = 1)}{\Pr(Y = 1)}}_{\text{Usual expression for Bayes' rule}}. \end{aligned} \quad (2)$$

Example of a theorem:

Theorem 1 (Euclid). *There are infinitely many primes.*

Euclid's proof. There is at least one prime, namely 2. Now pick any finite list of primes p_1, p_2, \dots, p_n . It suffices to show that there is another prime not on the list. Let $p := \prod_{i=1}^n p_i + 1$, which is not any of the primes on the list. If p is prime, then we're done. So suppose instead that p is not prime. Then there is prime q which divides p . If q is one of the primes on the list, then it would divide $p - \prod_{i=1}^n p_i = 1$, which is impossible. Therefore q is not one of the n primes in the list, so we're done. \square

Here is a centered table.
